

*Dan McShea*

Dan McShea is faculty in Biology at Duke University, with a secondary appointment in Philosophy. His main research interest has been large-scale evolutionary trends, in particular the trend in the complexity of organisms over the history of life. In recent years, he has turned to the problem of goal-directedness in biology, from simple animal tropisms to the affective or emotional structures that drive mammalian behavior, including human behavior. He has co-authored two books: *Biology's First Law* (2010) and *The Philosophy of Biology: A Contemporary Introduction* (2007).
